                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             recombinant DNA techniques. The poptide antigonists are used as an antiinflammatory agents in the treatment of gastrointestinal confirmation, where they bind to the ZOT receptor in the intestine conditions give rise to intestine. Gastrointestinal inflammation conditions give rise to concreased intestinal permeability and the peptide is useful for treating intestinal permeability and the peptide is useful for caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations; e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, correction of congenital heart disease with Fontan's operation, collagenous disease, with Fontan's operation, collagenous disease, eosinophilic gastroenteritis, and interesting collagenous disease, eosinophilic gastroenteritis, and immune disease, e.g. systemic lupus er/thematosus or food allergies, primarily to

Trecombinant DNA techniques. The peptide antagonists are used as an CC antiinflammatory agents in the treatment of gastrointestinal CC inflammation, where they bind to the ZOT receptor in the intestine CC inflammation, where they bind to the ZOT receptor in the intestine CC and yet does not physiologically modulate the opening of TJ in the CC intestine. Gastrointestinal inflammation conditions give rise to CC increased intestinal permeability and the peptide is useful for CC treating intestinal conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, CC enterocolitis, shigellosis, viral gastroenteritis, parasite CC infestation, bacterial overgrowth, whipple's disease, diseases with CC mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, CC lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, CC sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical CC correction of congenital heart disease with Fontan's operation, CC mucosal disease, eosinophilic gastroenteritis, and immune disease, coeliac disease, eosinophilic gastroenteritis, and immune disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, and a surgical coeliac disease, eosinophilic gastroenteritis, and immune diseases, coeliac disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            which bind to a zonula occludens toxin (ZOT) receptor, functions which bind to a zonula occludens toxin (ZOT) receptor. Physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor and human zonulins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and human zonulins, which is believed to be critical for receptor to binding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an CC antiinflammatory agents in the treatment of gastrointestinal CC inflammation, where they bind to the ZOT receptor in the intestine CC inflammation, where they bind to the ZOT receptor in the intestine CC intestine. Gastrointestinal inflammation conditions give rise to CC increased intestinal permeability and the peptide is useful for CC treating intestinal conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, CC infestation, bacterial overgrowth, whiple's disease, diseases with CC infestation or ulcerations, e.g. gastrits, gastric cancer, CC collagenous colltis, inflammatory bowel disease, diseases marked by imphatic obstruction, e.g. congenital intestinal lymphangicctasia, CC sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, CC mucogal disease, without ulceration, e.g. Menetrier's disease, cosinophilic gastroenteritis, and immune disease, cosinophilic gastroenteritis, paralleries, primarily to

The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor and performs to the prepared by chemical synthesis or by use of binding. They can be prepared by chemical synthesis or by use of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a human guanylin preprohormone which is cleaved to generate a 15 amino acid mature peptide (Y42458). This sequence is the encoded protein from a composite DNA sequence isolated by probing a human duodenum cDNA library with the corresponding rat coding sequence. Guanylin is an intestinal guanylate cyclase regulator which has similarity to bacterial heat stable enterotoxins which activate intestinal guanylate cyclases. The guanylin peptide can be used as a laxative in the treatment of constipation.

Guanylin is an intestinal guanylate cyclase regulator which has similarity to bacterial heat stable enterotox:ns which activate intestinal guanylate cyclases. The guanylin peptide can be used as a laxative in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               30-JUL-1999

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   as compared to the human protein only.

The invention relates to 125 novel genes and their fragments (nucleic acid sequences: x84933-x85057; amino acid sequences r27567-x27933) which are useful for preventing, treating or ameliorating medical conditions eight protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides, based on which tissues they are most highly expressed in (see x84933 for described for described in see the second tissues they are most highly expressed in (see x84933 for described for described for described in see the second described for described for described in see x84933 for described for describ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  23-MAR-2000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a secreted human protein encoded by the clone detailed in the descriptor line. The gene can be used to group proteins by linking to the gene to a human immunoglobulin portion (e.g. X84924) for increasing the stability of the fused p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              uses).

The method comprises administering to the host an effective amount of a 20t-related immunoregulator selected from 20t (zonula occludens toxin) zonulin, the amount effective to down-regulate the activity of the APC.

recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine cand yet does not physiologically modulate the opening of TV in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglactasia, carcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetries's disease, coeliac disease, eosimphilic gastroenteritis, and immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           corresponding to residues 8-15 of human foetal intestinal zonulin. It is one of 25 peptide antagonists (see Y79105-29) of the invention that bind to a zonula occludens toxin (ZOT) receptor. Vet do not physiologically modulate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                that bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1;

The peptide antagonists are based on a common motif of ZOT C and human zonulins, which is believed to be critical for receptor C binding. They can be prepared by chemical synthesis or by use of C recombinant DNA techniques. The peptide antagonists are used as an initial mumatory agents in the treatment of gastrointestinal C inflammation, where they bind to the ZOT receptor in the intestinal canditorially modulate the opening of TJ in the C intestine. Gastrointestinal inflammation conditions give rise to C increased intestinal conditions that cause protein losing enteropathy c treating intestinal conditions that cause protein losing enteropathy c caused by infection, e.g. Clostridium difficile infection, c enterocolitis, shigelissis, viral gastroenteritis, parasite c infestation, bacterial overgrowth, whipple's disease, diseases with C collagenous colitis, inflammatory bowel disease, diseases with course arcidosis and after surgical c sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical c correction of congenital heart disease with Fontan's operation, c collac disease, eosin-philic gastroenteritis, and immune diseases, c celiac disease, eosin-philic gastroenteritis, and immune diseases, c milk.

Zonulin proteins function as CC physiological modulators of mammalian tight junctions. They can be used CC physiological modulators of mammalian tight junctions. They can be used CC junctions of intestinal and nasal mucosa and across tight junctions of intestinal and nasal mucosa and across tight junctions of the blood brain barrier. Zonulin can be used with agents such as drugs, CC e.g. lidocaine, adenosine, dobutamine, dopamine, epinephrine, or convepinephrine, maloxone, ketorolac, midazolam, propofol, metacurine, CC unterprenorphine, naloxone, ketorolac, midazolam, propofol, metacurine, CC univacurium, succinylcholine, cytarabine, mitomycin doxorubicin, cefenicid, cefmetazole and azrreonam, a hormone e.g. cetoxitin, cefenicid, cefmetazole and azrreonam, a hormone e.g. testosterone, nandrolene, menotropins, insulin, urofolitropin, interferon-alpha, interferon-beta, interferon-gamma, interleukin-1 conteriors can also be used for the production of antibodies which can be used to assay for zonulin in body tissue or fluids, or in affinity-coparide of zonulin. The present sequence represents an N-terminal coparide of zonulin.
                                                                                                                                                       Human foetal intestine zonulin N-terminal sequence.
                                                                                           gastrointestinal inflammation;
                                                                                                                              Zonulin;

Primers JO2, JO3, JO4, JO14 and VH1BACK (Q62765-Q62769) were all used to prepare cDNAs that encode the BrE-3 mouse Ig variable domains. The amplified V-regions lacked constant regions so as to produce less immunogenic polypeptides. A hybrid polypeptide was prepared using human constant regions with the murine V regions. The chimeric polypeptide retained the binding affinity of BrE-3 for human milk fat globule. The amino acid sequences deduced from the amplified VL and VH regions were compared to N-terminal sequences which had been determined directly (i.e. R52792 and

This present sequence is that of a peptide antagonist of zonulin (C12), one of 25 such peptides (see Y79105-29) of the invention, CC which bind to a zonula occludens toxin (ZOT) receptor, yet do not CC physiologically modulate the opening of mammalian tight junctions CC (TJ). The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthésis or by use of CC recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agent; in the treatment of gastrointestinal CC inflammation, where they bind to the ZOT receptor in the intestine CC and yet does not physiologically modulate the opening of TJ in the CC intestine. Gastrointestinal inflammation conditions give rise to concreased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile sparasite infestation, bacterial overgrowth, whipple's disease, diseases with CC collagenous colitis, inflammatory bowel disease, diseases marked by

and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropath,
                                                                                                                                          This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding.
                                                                                                                                                                                                                                                                      Claim 1; Page 46; 69pp;
                                                                                                                                                                                                                                                                                                New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis

J. Bacteriol. 171:929-939(1999).

I. FÜNCTION: FIXI IS A PUMP OF A SPECIFIC CATION INVOLVED IN SYMBIOTIC NITROGEN FIXATION. THE FOUR PROTEINS FIXG, FIXH, FIX AND FIXS MAY PARTICIPATE IN A MEMBRANE-BOUND COMPLEX COUPLING THE FIXI CATION PUMP WITH A REDOX PROCESS CARALYZED BY FIXG.

I. CATALYZIC ACTIVITY: ATP + H(2)0 = ADP + ORTHOPHOSPHATE.

I. SUBCLIULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

I. SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY (E1-E2 ATPASES). SUBFAMILY IB.

I. SIMILARITY: CONTAINS 1 HEAVY-METAL-ASSOCIATED (HMA) DOMAIN.
                                                                                                                                                                                                                                         use by non-profit institutions as lon-
